1. Are the following languages context-free? Prove your answer in each case.
 - (a) $\Sigma = \{0, 1\}^*, L = \{xy \mid |x| = |y|, x \neq y\}$
 - (b) $\Sigma = \{0, 1\}^*, L = \{w \mid n_0(w) = n_1(w) \text{ and } w \text{ includes the string '001'}\}$ where $n_0(w)$ and $n_1(w)$ denote the number of 0s and 1s in w respectively.
2. Let G be a CFG in Chomsky normal form, and $w \in L(G)$. How long is w if there is a derivation of w using p steps? Explain why.
3. Let G be a CFG. Explain an algorithm to determine whether $L(G)$ is finite. (Hint: use the pumping lemma).
4. Convert the CFG

$$\begin{aligned} S &\rightarrow E \\ E &\rightarrow E + T \mid T \\ T &\rightarrow T \times F \mid F \\ F &\rightarrow (E) \mid a \end{aligned}$$

to an equivalent PDA.

5. Recall that the class of context-free language is closed under the regular operations, union, concatenation, and star. Prove that every regular language is context free by showing how to convert a regular expression directly to an equivalent context-free grammar.
6. Consider the CFG G given by

$$S \rightarrow aSbS \mid bSaS \mid \epsilon$$

Prove that $L(G)$ is the set of strings with an equal number of as and bs .

7. Show the following grammar is ambiguous by drawing parse trees. Find an unambiguous grammar for this language.

$$S \rightarrow aSb \mid Sb \mid \epsilon$$

8. Let P be the language of all palindromes over $\{0, 1\}$ containing equal numbers of 0s and 1s. Show that P is not context free.
9. The language $L = \{ww : w \in \{a, b\}^*\}$ is not context free. However, show that the complement language, \bar{L} , is context free.

10. Is there a *universal* pushdown automaton? That is, there is a single pushdown automaton, say M such that given a string $s_G w$, where s_g is a string that describes a context free grammar and w is an input string, M accepts $s_G w$ if and only if G generates w ? Explain your answer.
